Abstract

Background: Formal non-discrimination language can coexist with material and procedural barriers that make theological education inaccessible. **Objective:** This study examined the physical, educational, technological and policy conditions affecting access for persons with physical disabilities in sampled Anglican seminaries in Nigeria. **Methods:** The article reports the institutional strand of a post-defence harmonised sequential explanatory mixed-methods Ph.D. study. Seminary Accessibility Assessment Tool (SAAT) audits and Seminary Policy Analysis Matrix (SPAM) reviews were completed at 10 seminaries in five geopolitical zones. The SAAT assessed entrances, learning spaces, worship, sanitation, residence, alternative formats, library access, assistive technology and digital resources; SPAM assessed whether inclusion commitments were present and whether implementation mechanisms were documented. **Results:** Overall SAAT accessibility was 19.8%. The highest domain was chapel/worship access (35%), while dormitory/accommodation access was 9%, alternative formats 5% and assistive technology 3%. Nine of 10 seminaries had a general disability non-discrimination statement, but only one showed systematic implementation. Admission accommodation policies were present in 20% of institutions but had no documented implementation; academic accommodation was present in 10% with no documented implementation; no institution documented disability-specific financial aid or a field-education accessibility plan. **Conclusion:** The dominant institutional problem was not a lack of declaratory commitment but a governance gap between statement, procedure, budget, responsibility and remedy. Accessibility should be treated as a core quality standard of ministerial formation, supported by annual audits, phased universal-design investment and enforceable accommodation processes.

Keywords: seminary accessibility; disability inclusion; Anglican theological education; reasonable accommodation; policy implementation; universal design; Nigeria

1. Introduction

Access to theological education is often discussed as a matter of admissions, yet admission is only the first institutional gate. A student may be formally admitted and still be excluded by steps at the entrance, inaccessible sanitation, residential spaces that require constant assistance, inaccessible learning materials, or the absence of any procedure for requesting reasonable accommodation. The built environment and the policy environment therefore operate together.

Disability-justice scholarship treats access as a matter of institutional design rather than individual resilience. Barton (2021) argues that theological education must move beyond case-by-case accommodation toward structural access, while Carter et al. (2023) show that participation in religious communities is shaped by both physical accessibility and congregational attitudes. The human-rights model likewise locates responsibility in the removal of barriers and the provision of equal participation rather than in the correction of the person (Degener, 2016).

In Nigeria, seminaries occupy a distinctive position because they combine academic study, residential life, worship, spiritual formation and field placement. A barrier in any one of these domains can interrupt ministerial formation. This article therefore treats accessibility as a system of interdependent physical, technological and governance conditions.

1.1 Aim

The aim was to quantify the accessibility of sampled Anglican seminaries and examine whether formal disability-related policy commitments were accompanied by documented implementation mechanisms.

2. Analytical framework: access as institutional quality

The analysis uses a simple governance proposition: a credible inclusion commitment requires at least five linked elements—standard, responsible owner, procedure, resource and remedy. A non-discrimination statement supplies only the standard. Without a named decision process, budget or responsible office, applicants and students remain dependent on discretionary goodwill. This is especially risky in residential and ministerial formation settings, where needs may involve transport, worship participation, library access, field education and placement.

Universal-design thinking complements this governance approach by asking whether environments are designed for human diversity from the outset. Reasonable accommodation remains necessary because no universal design can anticipate every individual need, but it should operate as a predictable institutional process rather than an improvised favour.

3. Materials and Methods

3.1 Institutional sample

The realised institutional sample comprised 10 Anglican seminaries across five geopolitical zones. This post-defence correction is important: the institutional evidence should not be represented as six-zone coverage. The 10 institutions nevertheless provided a diverse multi-site basis for comparing access conditions and policy practice.

3.2 Seminary Accessibility Assessment Tool

The SAAT was used to assess physical infrastructure, educational resources and technological provisions. Domains reported in the accepted results included entrances/ramps/pathways, classrooms and libraries, chapel/worship spaces, restrooms, dormitories/accommodation, alternative formats, library access, assistive technology and website/digital-resource accessibility. Domain results were summarised as average compliance percentages, with an overall institutional mean.

3.3 Seminary Policy Analysis Matrix

SPAM reviewed policy presence and documented implementation for disability non-discrimination, admission accommodation, academic accommodation, financial aid for disability needs, curricular inclusion of disability theology and field-education accessibility. The distinction between policy presence and implementation was retained because a statement without an operative mechanism does not establish that students can obtain accommodation in practice.

Table 1. Institutional measures and decision questions.

Instrument	Domain	Decision question
SAAT	Physical, educational and technological access	Can a student enter, live, learn, worship and use institutional resources with reasonable independence?
SPAM	Formal policies and implementation	Is inclusion documented as a procedure with operational mechanisms rather than a general statement?

4. Results

4.1 Physical, educational and technological accessibility

The overall SAAT score was 19.8%, indicating low accessibility across the audited domains. Chapel and worship spaces recorded the highest reported compliance at 35%, followed by entrances/ramps/pathways at 28% and

library access at 24%. Classrooms and libraries were 21% compliant and digital resources 18%. Sanitation and residential conditions were particularly weak: restrooms scored 15% and dormitories/accommodation 9%. Resources relevant to students with sensory impairments were lowest, with alternative formats at 5% and assistive technology at 3%.

Figure 1. SAAT accessibility domain scores across the 10 sampled seminaries. The dashed line marks the overall institutional mean of 19.8%. Source: post-defence harmonised thesis results.

Table 2. SAAT domain results.

Accessibility domain	Average compliance
Entrances/ramps/pathways	28%
Classrooms & libraries	21%
Chapel/worship spaces	35%
Restrooms	15%
Dormitories/accommodation	9%
Alternative formats	5%
Library access	24%
Assistive technology	3%
Digital resources	18%
Overall accessibility	19.8%

4.2 Policy presence versus implementation

The policy analysis revealed a sharper governance problem. A disability non-discrimination statement was present in 90% of institutions, but systematic implementation was documented in only 10%. Admission accommodation procedures were present in 20% and academic accommodation in 10%, yet neither category showed documented implementation. No institution had a disability-specific financial-aid mechanism or a field-education accessibility plan. Disability theology appeared in the curriculum of one institution, which was also the only category in which presence and implementation were both recorded at 10%.

Figure 2. Policy presence and documented implementation in the Seminary Policy Analysis Matrix. Source: post-defence harmonised thesis results.

Table 3. SPAM results.

Policy area	Policy present	Implementation documented
Non-discrimination	90%	10%
Admission accommodation	20%	0%
Academic accommodation	10%	0%
Disability financial aid	0%	0%
Disability theology curriculum	10%	10%
Field education plan	0%	0%

5. Discussion

The combination of a 19.8% overall accessibility score and a 90%/10% statement-to-implementation gap is analytically more significant than either result alone. It shows that institutional exclusion is both material and administrative. Low physical access constrains what students can do; weak policy implementation constrains whether they have a predictable route to request change. Together they create a system in which inclusion depends on individual negotiation.

Barton's (2021) disability-justice framework is useful because it treats access as a matter of institutional responsibility rather than benevolence. A step-free entrance is not an optional courtesy to an individual wheelchair user; it is part of the institutional capacity to educate a diverse student body. The same reasoning applies to accessible sanitation, dormitories, digital resources and field education. In a seminary, these are not ancillary services. Residential life, worship and supervised ministry are integral to formation.

The policy findings also show why non-discrimination language should not be treated as evidence of inclusion by itself. A statement may articulate a moral norm, but students still need to know who receives an accommodation request, what evidence is required, who decides, what can be appealed, how costs are met and how confidentiality is protected. Without those mechanisms, inclusion remains dependent on personality and local goodwill.

5.1 From audit to reform

The post-defence implementation matrix in the parent study provides a practical sequence. A church-level disability-inclusion standard should establish the baseline; every seminary should be audited; admissions and reasonable-accommodation procedures should be published; built-environment improvements should be phased

and budgeted; faculty should receive disability-theology and inclusive-pedagogy formation; and disabled students and alumni should participate in review structures. The important principle is that responsibility is shared but not diffused.

5.2 Priority setting under resource constraints

Low-resource institutions may be unable to retrofit every facility immediately, but scarcity does not justify procedural absence. Priority should begin with life safety, basic routes, sanitation, sleeping accommodation, chapel/classroom access and a clear accommodation process. Annual SAAT-style self-assessment can then track improvement. Capital projects should apply universal-design criteria at the design stage because retrofitting is usually more expensive than accessible construction from the outset.

6. Limitations

The results describe 10 sampled seminaries in five geopolitical zones and should not be interpreted as a census of all Anglican theological institutions in Nigeria. The SAAT and SPAM findings are institutional summaries and do not establish causal effects on admission, retention or ordination outcomes. The article also does not rank named institutions; publication is intentionally aggregate to protect institutional and participant confidentiality and to emphasise system reform rather than reputational comparison.

7. Conclusion

The sampled Anglican seminaries displayed a substantial access deficit. The central institutional finding is the coexistence of declaratory inclusion with weak operational capacity: general non-discrimination language was common, but documented procedures, budgets and accessibility resources were rare. A seminary becomes accessible not when it expresses goodwill but when a person can enter, live, learn, worship, request accommodation, participate in placement and obtain remedy through ordinary institutional processes. Accessibility should therefore be treated as a quality standard of theological education and a visible expression of ecclesial responsibility.

Declarations

Table. Publication declarations and research-integrity information.

Declaration	Statement
Study provenance	Institutional-access paper derived from the post-defence harmonised Ph.D. thesis of Peter Ukule.
Confidentiality	Results are aggregated across institutions; the article does not publish institution-specific scores or identifiable participant material.
Data availability	Aggregate SAAT and SPAM results are reported in the thesis. Underlying institutional records remain subject to the parent study's confidentiality and data-management conditions.
Authorship	Peter Ukule led the doctoral research; Charles Ogundu Nnaji and Adeola Kehinde supervised the study and are co-authors of this focused article.
